

Radio frequency (RF) interference can cause major quality of experience issues for your customers. Dropped calls, decreased battery life, poor voice quality, and reduced data throughput can all be caused by interference.

Locating an interference source using traditional methods can take days, if not weeks, costing you valuable time, money, and potential customer churn.

At Viavi Solutions, we worked with major service providers to come up with a better solution.

InterferenceAdvisor™ is a fully-automated interference hunting solution. Easy to set up and simple to use, it allows one RF engineer to identify and locate an interference source in just hours, simply by following voice prompts on a familiar map-style application on an Android tablet.
